

## fReactor PhotoFLOW

### Unlocking Photochemistry in Flow

The fReactor PhotoFLOW module was developed by the University of Leeds in conjunction with Asynt and gives scientists the potential to develop and expand their Flow Chemistry work quickly and easily to include photochemistry.

### “Plug-and-glow” technology

Available to purchase individually, each fReactor PhotoFLOW module is positioned over the desired fReactor position in your set-up with easy to use plug-and-glow technology. With a fully customisable configuration possible, you can choose to use just one of these compact Photo modules on one of the 5 fReactor CSTRs, or add further Photo modules for up to five positions running simultaneously. You can run all five of these from just one power supply using optional splitter leads.

Heating and agitation is provided by any magnetic hotplate stirrer.

Each fReactor PhotoFLOW module sits directly over the individual CSTR.

Currently available in two wavelengths:

- 460 nm (Blue) 10w LED COB chips
- 365 nm (UV) 10w LED COB chips

## fReactor PhotoFLOW: Key Features

### Customise your fReactor setup

- fReactor PhotoFLOW photochemistry reactors available individually for easy customisation of your reaction setup.
- High photon flux levels from 365nm upwards .
- Demonstrated capabilities to give high productivity in homogeneous systems .
- Ability to handle different reaction regimes (short to long residence times) .
- Combines the ability to handle multiphasic flows (L/S and G/L) with photochemistry .
- Suitable for heating up to 55 °C max.
- One power supply is sufficient for up to five modules via connection splitter.
- Designed and manufactured in the UK.

The [fReactor platform](#) was developed by the University of Leeds and Asynt Ltd to offer an affordable entry point into the world of flow chemistry.

fReactor provides an expanding platform of intuitive and flexible flow reactors for the development of materials and synthesis routes.

Integrating the efficiency of pipe-flow processing with the advanced mixing of a CSTR, the fReactor delivers a general “plug-and-play” setup which is well-suited to multiphasic reactions; allowing chemists to explore continuous-flow processing, with little expertise required.
